# Dijkstra's Algorithm

# Dijkstra's Algorithm

```
Get the next unvisited node u with min. d[u]  
foreach( Node v in neighbors(u) ) do  
    d[v] = min( d[v], d[u] + edgeWeight(u,v) );
```

# Dijkstra's Algorithm

Get the next unvisited node  $u$  with min.  $d[u]$   
**foreach**( Node  $v$  **in** neighbors( $u$ ) ) **do**  
     $d[v] = \min( d[v], d[u] + \text{edgeWeight}(u,v) );$

# Dijkstra's Algorithm

```
Get the next unvisited node u with min. d[u]
foreach( Node v in neighbors(u) ) do
    d[v] = min( d[v], d[u] + edgeWeight(u,v) );
```

# Dijkstra's Algorithm

```
Get the next unvisited node u with min. d[u]
foreach( Node v in neighbors(u) ) do
    d[v] = min( d[v], d[u] + edgeWeight(u,v) );
```

# Dijkstra's Algorithm

```
Get the next unvisited node u with min. d[u]  
foreach( Node v in neighbors(u) ) do  
    d[v] = min( d[v], d[u] + edgeWeight(u,v) );
```

# Dijkstra's Algorithm

```
Get the next unvisited node u with min. d[u]
foreach( Node v in neighbors(u) ) do
    d[v] = min( d[v], d[u] + edgeWeight(u,v) );
```

# Dijkstra's Algorithm

```
Get the next unvisited node u with min. d[u]  
foreach( Node v in neighbors(u) ) do  
    d[v] = min( d[v], d[u] + edgeWeight(u,v) );
```

# Dijkstra's Algorithm - Pseudo-code (version1)

## Implementation with a PriorityQueue

$O(M * \log(N))$   
M edges  
N nodes

**Dijkstra**( $G = (V, E)$ , startNode):

**foreach** Node  $v$  **in**  $V$  **do**

    distance[v] =  $\infty$ ;

    visited[v] = false;

    priorityQueue.insert(node, distance[v]);

**endfor**

distance[startNode] = 0;

priorityQueue.update(startNode, 0);

**while** priorityQueue **is not** empty() **do**

    Node  $u$  = priorityQueue.getMin(); //  $O(1)$

**foreach** Node  $v$  **in** neighbors( $u$ ) *such that* visited[v] == false **do**

        distance[v] = min( distance[v], distance[u] + edgeWeight(u, v) );

**if** distance[v] is updated **then**

            priorityQueue.update( v , distance[v] ); //  $O(\log N)$

**endif**

**endfor**

    visited[u] = true;

    priorityQueue.removeMin(); //  $O(\log N)$

**endwhile**

**return** distance;

# Dijkstra's Algorithm - Pseudo-code

Implementation with a PriorityQueue

$O(M * \log(N))$

M edges

N nodes

**Dijkstra**( $G = (V, E)$ , startNode, **endNode**):

**foreach** Node  $v$  **in**  $V$  **do**

$\text{distance}[v] = \infty$ ;

$\text{visited}[v] = \text{false}$ ;

$\text{priorityQueue.insert}(\text{node}, \text{distance}[v])$ ;

**endfor**

$\text{distance}[\text{startNode}] = 0$ ;

$\text{priorityQueue.update}(\text{startNode}, 0)$ ;

**while**  $\text{priorityQueue}$  **is not** empty() **do**

    Node  $u = \text{priorityQueue.getMin}()$ ; //  $O(1)$

**endwhile**

**return** distance, path ;

How to get the actual shortest path  
between two nodes using Dijkstra?

- 1) Compute a parent map
- 2) Move thru' the parent map after emptying the priority queue.

```
std::vector<Node*> path;  
Node* curNode = endNode;  
while(curNode != nullptr)  
{  
    endNode.push_back(curNode);  
    curNode = parent[curNode];  
}
```

# Dijkstra's Algorithm

- marking the nodes in the shortest path

From A to E
